## MATHEMATICS VOCABULARY LIST KINDERGARTEN THROUGH 6<sup>TH</sup> GRADE LEVELS

An underlying assumption of the mathematics education reform movement is that all children can and will learn mathematics, including children from groups that are traditionally underrepresented in science, technology, engineering and mathematics (STEM) careers. One of the major recommendations of the reform movement is that students are to communicate mathematically using a variety of tools, including written and spoken language (NCTM 1989, 2000).

This vocabulary list is for teachers to help develop children's mathematics language and covers mathematics words and terms relating to most elementary mathematics curricula including the National Council of Teachers of Mathematics (NCTM) *Curriculum Standards in Mathematics Teaching*, Massachusetts *Curriculum Frameworks* and the United Kingdom's *Framework for Teaching Mathematics*. It addresses vocabulary needs in mathematics content areas from Kindergarten through sixth grade (age levels 5 years to 11 years). The words and terms included are from mathematics content: *Number sense* (Numbers and the number system), calculations; *mathematics language and solving problems*; *statistics and probability*—handling data and chance; *patterns*—generalizations, relations, functions and algebra; and *spatial sense*—geometry, measures, shape and space.

## Organization of the Vocabulary Lists: How can it be used?

The mathematics vocabulary list was developed on the same principles, manner and for the purpose as most common language word lists—to develop a minimal vocabulary to facilitate participate in communication. The goal of this list is to help teachers introduce appropriate mathematics vocabulary at each grade—from Kindergarten through sixth. Although, we have tried to include most words that are used at these grade levels, these Vocabulary Lists are not intended to be exhaustive, you can add more words as you see fit. It is a dynamic list. It should grow with the curriculum.

#### Why do have the list only for the grades K through 6?

This is a minimum vocabulary list of mathematics words and terms at each grade level. If children have learned and mastered the use of these vocabulary words, they are in a good standing to make sense of more advanced mathematics vocabulary. They have the skills and experience to extend their mathematics vocabulary. Moreover, after sixth grade, the mathematics courses become more specialized and content specific and most

teachers should develop and use the vocabulary of the textbook in use. These textbooks have and emphasize development and use of a specific vocabulary pertinent to the topics covered. At these levels, the teachers need to focus on how to develop that specific vocabulary in the context of the content.

### How to Introduce the Vocabulary?

A teacher should identify the words and terms from the grade list to generate the vocabulary related to the content of the lesson she is planning. In every lesson, the teacher should make provisions for the introduction of new vocabulary and the consolidation of familiar terms. The teacher should select few words from the grade list relevant to the topic and content being taught and try to develop them during the week. She can ask support staff and parents to use and emphasize this vocabulary with their children for use and mastery.

For students with a history of word recognition difficulties, the Mathematics Graded Word List may provide valuable information as to a student's mathematics difficulties. These Mathematics Graded Word Lists can also be used to estimate the student's grade level as far as the language of mathematics is concerned.

The teacher should introduce the math prefixes and roots first casually and then more formally. The introduction of words, terms and definitions can take place at any level, but the Mathematics Vocabulary List indicates where these specific words should be mastered by children. It is appropriate to point out these words even to younger than K. In a casual manner, parents and teachers can remark, "a tricycle has 3 wheels. Tri- means 3 and cycle means wheels. A triangle has 3 angles because tri- means 3...."

With the introduction of each word, children are exposed to several related words and sentences and concepts that contain or use it. Then children use the word in their own sentences. The words and related concepts are then reviewed with the class as a group, built upon and tied with the new ideas that are introduced. This process is used to forming a working vocabulary.

Teachers should have a flipchart or a mathematics vocabulary wall in the classroom that has a running list of the mathematics vocabulary. The teacher and children should continuously add vocabulary words to this chart and revisit the words they already have on the chart.

#### **Mastering the Vocabulary:**

A child knows a mathematics vocabulary word when he can perform one or more of the following actions:

- define the word using other known words,
- describe the meaning of the word,
- use the word in a sentence or application, and/or
- use the word in a mathematical definition, formula or word.

Apart from the words that need to be learned for the specific mathematics lesson, on a particular day, the teacher should select a key mathematics word for the day which children use or define in the context of mathematics concepts, procedures or skills.

Each quiz or test should have one or more words or mathematical terms included to be defined or described by the student and should have definite credit for this part. We suggest that at least ten to fifteen percent of the test should deal with the linguistic components of mathematics.

While communicating mathematics, the teacher should insist on using the words correctly, precisely and in complete sentences. In no other language class, a teacher will accept poor presentations. The same standard should be adhered to in the mathematics language class. Sloppy language produces sloppy or incomplete ideas.

The mastery of the mathematics vocabulary lists is reflected in all aspects of reception, comprehension and production of mathematics language in following forms:

- Receptive This means that children can receive the vocabulary word and can act upon it successfully. The teacher should always ask learners to repeat the word or expression that has been used in a presentation of an idea to assure that they have received the idea. I want you to listen to me carefully. What did I just say?
- Expressive This means that the children can express the necessary vocabulary successfully. Example: (a) Put the cube on the box. Turn the box upside down and place the cube under it. Where am I putting the cube? I am putting the cube \_\_\_\_\_\_. (b) Write the sum of 4 and 6. What did you write? I wrote the \_\_\_\_\_\_.
- Word Recognition This means that the student can recognize the vocabulary correctly when reading a mathematics passage. In the sentence you just read, what did the word 'prime number' mean.

- **Recording** This means that the student can make the appropriate mathematics symbols and/or expressions associated with the words and expressions and can record the vocabulary word accurately related to mathematics symbols.
- **Instructional** This means that the student understands the task indicated by the word and can follow the appropriate instructions.
- **Informative** where the student understands the correct mathematical terminology and can apply that information to the task.
- **Transfer of Vocabulary** This means that the student can use the vocabulary word in another situation to give a successful explanation.
- **Generalization** This means that the student can use the language pattern derived from the vocabulary terms sensibly in a variety of contacts.

### DATA, PROBABILITY AND STATISTICS

**Analyze** to study the data in order to determine a solution or outcome

**Bar Graph** a graph that uses vertical or horizontal bars to show quantities/data

Circle Graph uses sections/sectors of a circle to represent percentages of the data being

shown

**Table/Chart** an organized data involving two or more variables organized in a table

form

**Data** a group of facts, numbers, information

**Diagram** a figure with geometrical and quantitative information

**Graph** a picture that shows information in an organized way

**Graphing** presentation of information in a pictorial way

**Interpret** to explain or tell the meaning of the data presented

**Line Graph** points are plotted on a grid to show two related pieces of data and then a

line is drawn connecting consecutive points

**Mean** the average or normal data for a given situation, divide the sum of the

measure by the number of measures

**Median** the middle number in a group of numbers listed in order from to largest

**Mode** is the most frequently occurring data

**Picture Graph** use pictures or drawings to represent the data that is being graphed

**Predict** tell beforehand

**Probability** the numerical measure of the number of times something can occur over

the number of events that could possibly occur, represented in ratio form

**Ratio** a comparison of two numbers or measures using division 2:4, 2 to 4, 2/4

**Stem and Leaf** best for data with a range of several decades, the plot is most frequently

organized by tens, the tens become the "stem" of the plot, the units are the

"leaves"

**Table** a chart representing data

**Tally Chart** a chart using notches, tallies

#### **GEOMETRY VOCABULARY LIST**

**Angle** two line segments that have the same endpoint

**Area** the measure of a region, expressed in square units

**Capacity** the amount of space that can be filled in a container; the measure of

content

Circle a plane figure in which all the points are the same distance for a point

called the center.

**Circumference** the perimeter of a circle

**Cone** a 3-dimensional figure with one curved surface, one flat surface, one

curved edge and one vertex

**Congruent** two figures are congruent if they are identical

**Corner** the point or place where converging lines, edges, or sides meet.

**Cube** a space figure that has squares for all of its faces.

**Cylinder** a space figure that has congruent circles for 2 faces.

**Degree** a unit for measuring angles

**Diameter** a chord that goes through the center of a circle

**Dimensions** the lengths of sides of a geometric figure, the number of ways a figure can

be measured

**Edge** the line where two faces of a solid meet

**Endpoint** a point marking either end of a line segment

**Equilateral** a triangle with all sides the same length

**Face** the name given to the flat surface of a solid or polyhedron

**Figure** a closed shape in 2 or 3 dimensions

**Flat Face** a level, unbroken surface

**Geometry** the mathematics of the properties and relationships of points, lines, angles,

surfaces, and solids

**Hexagon** a shape with 6 straight sides and 6 angles, a regular hexagon has all its

sides and angles the same size

**Intersecting lines** two lines that have exactly one point in common

**Isosceles** a triangle with two sides of equal length and two equal angles

**Line** a straight path that is endless in both directions

**Line of symmetry** a line on which a figure can be folded so that the two parts fit exactly

**Midpoint** the point on a line segment that divides it into two congruent segments

**Octagon** a polygon with 8 straight edges and 8 angles

**Obtuse** an angle with a measure greater than 90 degrees and less than 180 degrees

**Parallel** always the same distance apart

**Parallelogram** a quadrilateral with two pairs of parallel and congruent sides

**Parallel Lines** lines in the same plane that do not intersect

**Pentagon** a polygon that has five sides

**Perimeter** the distance around a figure

**Perpendicular** forming right angles

**Plane figures** figures that lie on a flat surface i.e.: square, circle, triangle

**Point** a single exact location, often represented by a dot

**Polygon** a closed figure consisting of straight line segments joined end to end

**Polyhedron** a 3 dimensional figure in which all surfaces are polygons

**Prism** a polyhedron with two ends exactly the same shape and size and parallel

to each other

**Quadrilateral** a four sided polygon, its four angles add up to 360 degrees

**Rectangle** a plane figure with 4 sides and 4 right angles

**Rectangle Prism** a space figure with six faces, it has a shape of a box

**Rhombus** a quadrilateral which has four sides of equal length and whose opposite

sides are parallel

**Right angles** an angle that has the same shape as the corner of a square

**Scalene** a triangle with no congruent sides

**Segment** a straight path from one point to another

**Side** a line segment connected to other segments to form a polygon, an edge of

a polyhedron

**Space Figure** a figure that is not flat but that has volume

**Sphere** a space figure that has the shape of a round ball

**Square** a plane figure that has four equal sides and four equal corners

**Symmetry** a shape may have none, one, two or more lines of symmetry, this means

there is a line that divides them into 2 equal parallel

**Trapezoid** a quadrilateral with exactly two parallel sides

**Triangle** a plane figure with three segments as sides

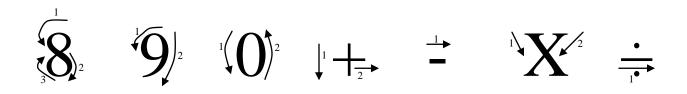

**Vertex** the corner or point where three or more edges meet

**Volume** the number of cubic units it takes to fill a figure

## **Forming Symbols**

In teaching any language to children, there is a great deal of emphasis placed on how to form the letters of the alphabet of that language. Strategies are taught to children how to remember efficiently, say them properly, identify them and then use them correctly. Since mathematics is a language, we should adopt the same care and methodology in forming the mathematics symbols and their representations. We should use sound and ergonomically accurate methods of writing mathematical symbols, letters, numbers and operational symbols. Today, there are many teachers at the early education (pre- and kindergarten level) who themselves were never taught to form letters, numbers and symbols correctly and therefore, they are neither interested nor able to teach the correct way of forming letters, symbols, and numbers.

$$1 + 2 + 3 + 4 + 3 + 5 = 6 + 7 = 1$$

$$\frac{4}{7}$$
 rather than 4/7 etc.
